

# Euky Bear™ Steam Vaporiser

## Quick Start Guide

**IMPORTANT: Ensure vaporiser is unplugged during set up.**

**1. Remove** heating module by turning **anti-clockwise** (This does not require excessive force and can be done with one hand).

- Shake inhalant before use. Add 10mL (approx 2 capfuls) of inhalant to the water container **BEFORE** filling with water.

- **Euky Bear Vaporiser Cleaning Tablets** should be used for the first operation, then every 3rd or 4th use to keep your vaporiser in optimal condition. Place the tablet in the centre of the water container **BEFORE** filling with water. Cleaning tablets are non-toxic so they can be used during normal operation. No need to run a separate cleaning cycle.

*NOTE: In areas with hard or mineralised water, use two **Euky Bear Vaporiser Cleaning Tablets** each time the vaporiser is used.*

**2. Add water** to container. Do NOT overfill. Lock heating module back into position by turning in a **clockwise** direction.

**3. Position** vaporiser on the floor at least 1.2 metres away from any person. To protect the floor or carpet, place the vaporiser on a rubber mat or other heat resistant, non-metallic barrier. DO NOT place vaporiser on a table, chair or other piece of furniture.

**4. Turn on vaporiser** by plugging into power point and switching on the power. The vaporiser will produce steam within 3 to 4 minutes. Ensure unit is turned off at the power point when not in use.

**5. Cleaning vaporiser is very important.** To keep your vaporiser in optimal condition, use **Euky Bear Vaporiser Cleaning Tablets** during regular operation as directed in the Operating Manual. After each use, empty the water container, rinse the heating module and container then ensure unit is dry before storing.

# The 20 cent safeguard that could save your vaporiser

Vaporiser - check. Water - check. Inhalant - check.  
But hang on... what about cleaning tablets?

One of the key causes of poor performance or failure to steam is mineral build up from not being cleaned properly.

## How mineral deposits affect your vaporiser

Calcium and magnesium in the tap water form a salty “crust” which sticks to the heating element. This insulating layer of crust means it produces less heat, boils the water at a lower temperature and produces less steam.

Over time the deposits can begin to corrode and disintegrate the heating element itself. The heating module can also become excessively hot, and possibly damaged, as blocked heat radiates upwards rather than into the water.

## How can you tell if your vaporiser is steaming poorly?

Sometimes it's hard to tell. A ‘dirty’ vaporiser might not have actually broken down yet, but it could be running at much less than its peak efficiency. You might see less steam coming out. You might hear it spitting or spurting. Or you might not. You may not realise it is running poorly until it stops altogether.

## Your vaporiser's best friend – cleaning tablets

Solution? Maintaining your vaporiser correctly from the start will help get the best out of your investment – both for your family's health and your budget.

**Euky Bear Vaporiser Cleaning Tablets** ‘steam while they clean’ helping prevent the formation of mineral deposits while you use your vaporiser as normal. They can also help remove built-up deposits, ensuring the heating element are clean and functioning correctly.

**Euky Bear Vaporiser Cleaning Tablets** have a RRP of around \$6 for 30 tablets – so for about 20 cents per use, they help provide peace of mind and maintain your vaporiser at peak efficiency.

You can use the cleaning tablets with any vaporiser, and they're non-toxic so can be used freely in children's rooms from newborn onwards.
